Exercise 20.3: Using losetup and parted

We are going to experiment more with:

- Loop devices and **losetup**
- **parted** to partition at the command line non-interactively.

We expect that you should read the **man pages** for **losetup** and **parted** before doing the following procedures.

Once again, you can reuse the image file or, better still, zero it out and start freshly or with another file.

1. Associate the image file with a **loop** device:

```
$ sudo losetup -f
```

```
/dev/loop1
```

```
$ sudo losetup /dev/loop1 imagefile
```

where the first command finds the first **free** loop device. The reason to do this is you may already be using one or more loop devices. For example, on the system that this is being written on, before the above command is executed:

```
$ losetup -a
```

```
/dev/loop0: []: (/usr/src/KERNELS.sqfs)
```

a **squashfs** compressed, read-only filesystem is already mounted using `/dev/loop0`. (The output of this command will vary with distribution.) If we were to ignore this and use **losetup** on `/dev/loop0` we would almost definitely corrupt the file.

2. Create a disk partition label on the loop device (image file):

```
$ sudo parted -s /dev/loop1 mklabel msdos
```

3. Create three primary partitions on the loop device:

```
$ sudo parted -s /dev/loop1 unit MB mkpart primary ext4 0 256
$ sudo parted -s /dev/loop1 unit MB mkpart primary ext4 256 512
$ sudo parted -s /dev/loop1 unit MB mkpart primary ext4 512 1024
```

4. Check the partition table:

```
$ fdisk -l /dev/loop1
```

```
Disk /dev/loop1: 1073 MB, 1073741824 bytes, 2097152 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk label type: dos
Disk identifier: 0x00050c11

      Device Boot      Start         End      Blocks   Id  System
/dev/loop1p1               1      500000      250000   83  Linux
/dev/loop1p2          500001     1000000      250000   83  Linux
```

```
/dev/loop1p3         1000001     2000000      500000   83  Linux
```

5. What happens next depends on what distribution you are on. For example, on **RHEL** and **Ubuntu** you will find new device nodes have been created:

```
$ ls -l /dev/loop1*
```

```
brw-rw---- 1 root disk   7, 1 Oct  7 14:54 /dev/loop1
brw-rw---- 1 root disk 259, 0 Oct  7 14:54 /dev/loop1p1
brw-rw---- 1 root disk 259, 3 Oct  7 14:54 /dev/loop1p2
brw-rw---- 1 root disk 259, 4 Oct  7 14:54 /dev/loop1p3
```

   and we will use them in the following.

6. Put filesystems on the partitions:

```
$ sudo mkfs.ext3 /dev/loop1p1
$ sudo mkfs.ext4 /dev/loop1p2
$ sudo mkfs.vfat /dev/loop1p3
```

7. Mount all three filesystems and show they are available:

```
$ mkdir mnt1 mnt2 mnt3

$ sudo mount /dev/loop1p1 mnt1
$ sudo mount /dev/loop1p2 mnt2
$ sudo mount /dev/loop1p3 mnt3

$ df -Th
```

```
Filesystem              Type      Size  Used Avail Use% Mounted on
/dev/sda1               ext4       29G  8.5G   19G  32% /
....
/dev/loop1p1            ext3      233M  2.1M  219M   1% mnt1
/dev/loop1p2            ext4      233M  2.1M  215M   1% mnt2
/dev/loop1p3            vfat      489M     0  489M   0% mnt3
```

8. After using the filesystems to your heart's content you can unwind it all:

```
$ sudo umount mnt1 mnt2 mnt3
$ rmdir mnt1 mnt2 mnt3
$ sudo losetup -d /dev/loop1
```
